#### The Q-tensor model for LC studies

The orientation of the nematic molecules is expressed via the  $3 \times 3$  symmetric tensor Q, which is the traceless part of the second moment of the probability density function matrix.

$$
\mathbf{Q} = \left( \begin{array}{ccc} q_1 & q_2 & q_3 \\ q_2 & q_4 & q_5 \\ q_3 & q_5 & -q_1 - q_4 \end{array} \right)
$$

つくい

### The Q-tensor model for LC studies

The orientation of the nematic molecules is expressed via the  $3 \times 3$  symmetric tensor Q, which is the traceless part of the second moment of the probability density function matrix.

$$
\mathbf{Q} = \left( \begin{array}{ccc} q_1 & q_2 & q_3 \\ q_2 & q_4 & q_5 \\ q_3 & q_5 & -q_1 - q_4 \end{array} \right)
$$

• In the general case of biaxial solutions, it can be decomposed into two directors and two order parameters,

$$
\mathbf{Q} = S_1 \left( \mathbf{n} \otimes \mathbf{n} \right) + S_2 \left( \mathbf{m} \otimes \mathbf{m} \right) - \frac{1}{3} \left( S_1 + S_2 \right) \mathbf{I}
$$

 $\Omega$ 

#### The Q-tensor model for LC studies

• The free energy in the LC bulk is expressed as

$$
F = \iiint_V F_b \ dV = \iiint_V (F_{\text{th}} + F_{\text{el}} + F_{\text{em}}) \ dV
$$

<span id="page-28-0"></span>The energy density functions  $F_{\text{th}}$ ,  $F_{\text{el}}$ ,  $F_{\text{em}}$  refer to the thermotropic, elastic, and electromagnetic contributions, respectively.

 $\Omega$ 

[Introduction](#page-2-0) [Theoretical Framework](#page-26-0) [Liquid Crystal Zenithal Bistable Gratings](#page-42-0) 000000000000

#### The Q-tensor model for LC studies

• The free energy in the LC bulk is expressed as

$$
F = \iiint_V F_b \ dV = \iiint_V (F_{\text{th}} + F_{\text{el}} + F_{\text{em}}) \ dV
$$

The energy density functions  $F_{th}$ ,  $F_{el}$ ,  $F_{em}$  refer to the thermotropic, elastic, and electromagnetic contributions, respectively.

**•** The free energy is minimized via the solution of the Euler-Lagrange equations

$$
\sum_{j=1}^3 \frac{\partial}{\partial x_j} \left( \frac{\partial F_b}{\partial q_{i,j}} \right) - \frac{\partial F_b}{\partial q_i} = \gamma_1^* \frac{\partial D}{\partial \dot{q}_i},
$$

for  $i = 1...5$ , where  $q_{i,j} = \partial q_i / \partial x_i$ ,  $x_i$  being the unit vectors of the three-dimensional cartesian system. The r.h.s. of [\(9\)](#page-28-0) describes the dynamic evolution of the **Q** tensor via the dissipation function  $D = \text{tr}(\dot{\mathbf{Q}}^2)$ , where  $\dot{\mathbf{Q}}=\partial\mathbf{Q}/\partial t.$  The term  $\gamma_{1}^{*}$  is related to the LC rotational viscosity  $\gamma_{1}$  via  $\gamma_1^*=\gamma_1/\left(4 S_{\rm exp}^2\right)$ 

 $200$ 

∢何 ▶ ∢ ヨ ▶ ∢ ヨ ▶

#### The Q-tensor model for LC studies

• The thermotropic energy  $F_{\text{th}}$  is expressed via a Taylor expansion around Q

$$
\mathcal{F}_{\mathrm{th}} = \mathsf{atr}\left(\mathbf{Q}^2\right) + \frac{2b}{3}\mathrm{tr}\left(\mathbf{Q}^3\right) + \frac{c}{2}\left(\mathrm{tr}\left(\mathbf{Q}^2\right)\right)^2
$$

 $\rightarrow$   $\equiv$   $\rightarrow$ 

and in

← 中 →

 $QQ$ 

00000000

[Introduction](#page-2-0) [Theoretical Framework](#page-26-0) [Liquid Crystal Zenithal Bistable Gratings](#page-42-0)

#### The Q-tensor model for LC studies

 $\bullet$  The thermotropic energy  $F_{\text{th}}$  is expressed via a Taylor expansion around Q

$$
\mathcal{F}_{\mathrm{th}} = \mathsf{atr}\left(\mathbf{Q}^2\right) + \frac{2b}{3}\mathrm{tr}\left(\mathbf{Q}^3\right) + \frac{c}{2}\left(\mathrm{tr}\left(\mathbf{Q}^2\right)\right)^2
$$

• The elastic energy is described by

$$
F_{\text{el}} = \sum_{i,j,k=1,2,3} \left[ \frac{L_1}{2} \left( \frac{\partial Q_{ij}}{\partial x_k} \right)^2 + \frac{L_2}{2} \frac{\partial Q_{ij}}{\partial x_j} \frac{\partial Q_{ik}}{\partial x_k} \right] + \sum_{i,j,k,l=1,2,3} \left[ \frac{L_6}{2} Q_{lk} \frac{\partial Q_{ij}}{\partial x_l} \frac{\partial Q_{ij}}{\partial x_k} \right]
$$

The elastic parameters  $L_i$  are related to the Frank elastic constants  $K_{ii}$  via the expressions  $L_1=(K_{33}-K_{11}+3K_{22})\,/\, \big(6 S^2_{\rm exp}\big),\, L_2=(K_{11}-K_{22})\,/\, S^2_{\rm exp},$  and  $L_6 = (K_{33} - K_{11}) / (2S_{\rm exp}^3).$

[Introduction](#page-2-0) [Theoretical Framework](#page-26-0) [Liquid Crystal Zenithal Bistable Gratings](#page-42-0) 000000000000

#### The Q-tensor model for LC studies

The electrostatic energy in the presence of an external electric field is given by

$$
\mathit{F}_{em}=-\int\textbf{D}\cdot d\textbf{E},
$$

The displacement field is given by the constitutive equation

$$
\textbf{D}=\varepsilon_0\tilde{\varepsilon}_r\textbf{E}+\textbf{P}_s,
$$

For nematic materials the dielectric tensor is given by

$$
\tilde{\varepsilon}_r = \Delta \varepsilon^* \mathbf{Q} + \bar{\varepsilon} \mathbf{I},
$$

where  $\Delta\varepsilon^* = (\varepsilon_{\parallel}-\varepsilon_{\perp})/S_{\mathrm{exp}}$  is the scaled dielectric anisotropy and  $\bar{\varepsilon}=(\varepsilon_{\parallel}+2\varepsilon_{\perp})/3.$ 

 $200$ 

∢ 何 ゝ ( ∃ ゝ ( ∃ ゝ )

#### The Q-tensor model for LC studies

 $\bullet$  The spontaneous polarization  $P_s$  derives from the flexoelectric effect:

$$
P_i = p_1 \sum_{j=1,2,3} \frac{\partial Q_{ij}}{\partial x_j} + p_2 \sum_{j,k=1,2,3} Q_{ij} \frac{\partial Q_{jk}}{\partial x_k},
$$

where  $p_1=(e_{11}+e_{33})/(2\mathcal{S}_{\rm exp})$  and  $p_2=(e_{11}-e_{33})/(2\mathcal{S}_{\rm exp}^2)$  are terms depending on the classical flexoelectric polarazation coefficients  $e_{11}$  and  $e_{33}$ , as in

$$
\textbf{P}_s = e_{11} (\nabla \cdot \textbf{n}) \, \textbf{n} + e_{33} (\nabla \times \textbf{n}) \times \textbf{n},
$$

where **n** is the nematic director.

 $QQ$ 

### Diffraction efficiency calculation in optical gratings

The efficiencies for the various diffraction modes in the proposed liquid-crystal gratings are calculated as follows:

- **1** The optical field distribution in a single period of the grating is obtained for a plane-wave excitation using the FEM method (COMSOL)
- $\textbf{\textcolor{red}{\bullet}}$  The optical transmitted field  $\textbf{\textcolor{red}{E}}^t$  is recorded at a constant plane in the grating's superstratum
- $\bullet$  The x $-$ component of  $\mathsf{E}^t$  is expanded in a 1-D Floquet series according to

$$
E_x^t(x,y=y_0)=\sum_m E_{x,m}^t e^{-j\beta_m y},
$$

where  $\beta_m = \beta_0 + 2\pi m/p_0$ ,  $\beta_0 = (2\pi n_{\rm g}/\lambda_0) \sin(\theta_{\rm inc})$  being the polymer wavenumber projection in the direction of periodicity  $(x-axis)$  for the general case of oblique [inc](#page-38-0)idence at an angle  $\theta_{\text{inc}}$ .

<span id="page-40-0"></span>

#### Diffraction efficiency calculation in optical gratings

 $\bullet$  The amplitudes  $E_{\mathsf{x},m}^{t}$  are obtained from orthogonality considerations with an integration over a grating period

$$
E_{x,m}^t = \frac{1}{p_0} \int_{y=y_0} E_x^t(x,y_0) e^{j\beta_m y} dx.
$$

 $200$ 

 $0000000$ 

#### Diffraction efficiency calculation in optical gratings

 $\bullet$  The amplitudes  $E_{\mathsf{x},m}^{t}$  are obtained from orthogonality considerations with an integration over a grating period

$$
E_{x,m}^t = \frac{1}{p_0} \int_{y=y_0} E_x^t(x,y_0) e^{j\beta_m y} dx.
$$

<sup>5</sup> Finally, the total diffraction efficiency for each diffraction mode is calculated by

$$
DE_m = \frac{P_m}{P^i} = \frac{|E_{x,m}^t|^2}{|E_x^i|^2 |\cos \theta_m|},
$$

where  $P^i$ ,  $E^i_x$  are the power and amplitude of the incident electric field, respectively, and  $\cos \theta_m$  is given by

$$
\cos\theta_m = \frac{\sqrt{(k_0 n_g)^2 - \beta_m^2}}{k_0 n_g},
$$

where  $k_0 = 2\pi/\lambda$  is the free space wavenumbe[r.](#page-40-0)

# Liquid Crystal Zenithal Bistable Beam Splitters

The sinusoidal ZB-LC grating shows two stable states with low (HAN) and high (VAN) tilt angle values.

- Defects are formed at the peak and trough of the grating for the HAN state.
- $\bullet$  The modulation of the  $q_i$  elements, and thus refractive index, is significantly lower in the HAN state.
- HAN state: in the vicinity of the grating LC molecules are aligned mainly along the grating vector  $(q_1(x, y)$  obtains high values).

つくい

 $\rightarrow$   $\pm$ 

# Liquid Crystal Zenithal Bistable Beam Splitters

- $\bullet$  The modulation of the  $q_i$  elements, and thus refractive index, is significantly lower in the HAN state.
- HAN state: in the vicinity of the grating LC molecules are aligned mainly along the grating vector  $(q_1(x, y)$  obtains high values).

• Matching condition: we opt for a polymer material whose refractive index  $n<sub>p</sub>$  is equal to the LC extraordinary index  $n<sub>e</sub> = 1.73$  for E7 at 633 nm. This minimizes diffraction in the HAN state.
